

# Configure TLS 1.2 as default secure Protocol On Windows Server 2008 R2 SP1

Let say you are running Exchange Server 2010 installed on Windows Server 2008 R2 SP1 x64(bit), and when you remotely open Outlook Web Access (OWA to the Exchange Server) in your Google Chrome web browser it alerts you that the installed SSL certificate is insecure. When you check the detail about the SSL certificate, the web browser is letting you know that the configured SSL protocols on the server are deprecated.

## Get an SSL Report of your Web Server's TLS and SSL configuration

As the Administrator, you first run an SSL Test and analysis of your webserver using the Qualys SSL Labs' SSL test from here: <https://ssllabs.com/sslltest/> in order to analyze which Secure Socket Layer (SSL) and Transport Layer Security (TLS) protocols are available, enabled and/or set as default within the registry of your Server. Before inputting your server's web address to run these tests and to obtain a report, it is recommended for the sake of your webserver's privacy that you check the checkbox next to: "Do not show the results on the boards."

## Update to enable TLS 1.1 and TLS 1.2 as default secure protocols in WinHTTP in Windows

This update provides support for Transport Layer Security (TLS) 1.1 and TLS 1.2 in Windows Server 2012, Windows 7 Service Pack 1 (SP1), and Windows Server 2008 R2 SP1.

To obtain the stand-alone package for this update, go to the Microsoft Update Catalog website here: <https://www.catalog.update.microsoft.com/search.aspx?q=kb3140245> and download and install the catalog update applicable to your server, such as "Update for Windows Server 2008 R2 x64 Edition (KB3140245).

Prerequisites for your server: To apply this update, you Windows Server 2008 R2 must have installed Service Pack 1 (SP1) for Windows 7 or Windows Server 2008 R2.

To understand why this update is or may be necessary, please review this Microsoft Support article: <https://support.microsoft.com/en-us/topic/update-to-enable-tls-1-1-and-tls-1-2-as-default-secure-protocols-in-winhttp-in-windows-c4bd73d2-31d7-761e-0178-11268bb10392>

## Configuration Information for TLS 1.2.

See: <https://support.laserfiche.com/kb/1013919/configuration-information-for-tls-1-2> or

<https://support.laserfiche.com/kb/1013919/raw>

Before attempting to edit your Windows registry, MAKE A BACKUP FILE OF YOUR REGISTRY.

In Windows Server 2008 R2 SP1, click start and in the Run box type regit.exe and press the enter key.

Select the "Computer" at the top of the Window's registry tree, right click Computer and left click "Export" and name and save the exported copy of your registry to a folder where you can import the registry backup at some time in the future if you happen to make a huge mistake while editing the Windows registry.
