Installing PHP 8.1.12 for Windows IIS 10

Download the Non-Threadsafe x64 (64-bit) version of PHP 8.1.12 (or latest version) from here https://windows.php.net/download#php-8.1

Unblock the Zip File (Properties - Clear Check Box - "This file came from another computer and is blocked . . . etc" Click OK.

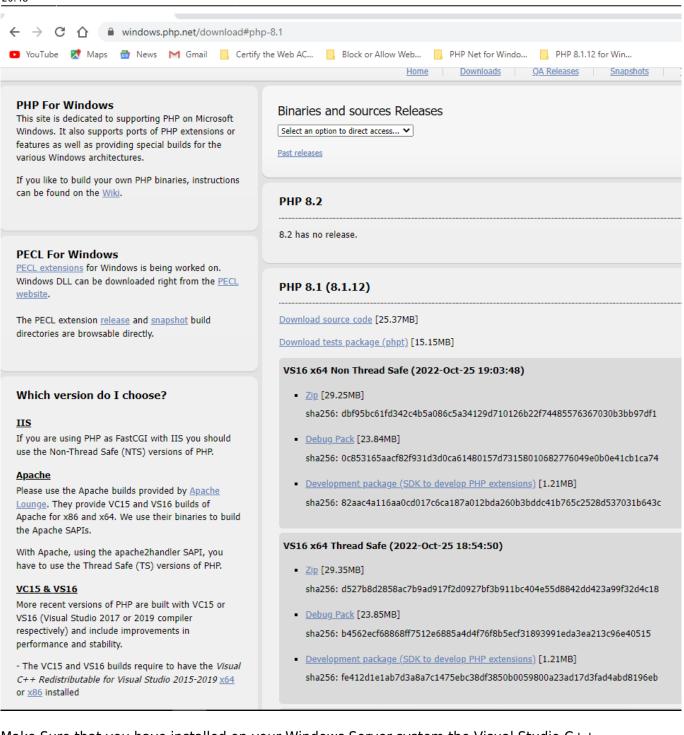

Unzip the Zip File to php_8_1

Using Windows file explorer, copy and paste the "php_8_1" directory (including its contained files and subdirectories) to your new and separate PHP path, such as c:\php_8_1

Using Notepad++ or similar advanced text editor, in the root of the php_8_1 directory, find and open the file "php.ini-production" and save as a new file named "php.ini" without the quotes.

Here is a snapshot of the Windows PHP8 download page which also lists the other requirements such as the Visual C++ Redistributable that must be installed on the Windows server system.

Last update: 2022/10/29 installing_php_8_1_12_windows_iis_10 https://installconfig.com/doku.php?id=installing_php_8_1_12_windows_iis_10&rev=1667076516 20:48

Make Sure that you have installed on your Windows Server system the Visual Studio C++ Redistributable 2015-2019 X64 (or x86 32-bit as applicable). To Check, in the Windows search (bottom left of screen next to START), type "Control Panel" and Click the hit to open it, and then open "Programs and Features" and then on the left click the link for "Turn Windows Features on or off. Check from the resulting list whether VS C++ 2015-2019 x64 is installed.

Configure Handler Mappings for FastCGI Module in IIS Manager

- Start IIS Manager by clicking on Start, Programs, Administrative Tools, and then Internet Information Services (IIS) Manager.
- 2. From the IIS Manager, click on the hostname of your server in the Connections panel on the left to add php mapper handling on a global basis (or instead select the hostname of the particular

- website if you are adding php mapper handling at the Website Level)
- 3. Double-click on the Handler Mappings icon. Insert a screen capture here depicting IIS and handler mappings
- 4. From the Handler Mappings Actions panel, click on Add Module Mapping.
- 5. Type the following information into the appropriate text boxes, and then click OK. Request path: *.php then Module : FastCGImodule then Executable: C:\php_8\php-cgi.exe then Name: FastCGI
- 6. Click OK, and then click Yes.
- 7. NOTE: If you are trying to add a new or additional *.php mapping (or remove script access from an existing php version) AT THE WEBSITE LEVEL IN IIS Server and you receive an error message that you don't have the necessary permissions to do so, then try clearing the checkmark next to "read-only" on the first tab of property pages for the file "web.config" in the root of the particular website.

se this feature to specify the resources, such as DLLs and managed code, that handle responses for specific request pes.							Add Managed Handler Add Script Map Add Wildcard Script Map Add Module Mapping
Add Module Mapping Request path: *.php Example: *.bas, wsvc.axd Module: FastCgiModule Executable (optional): C:\php_8_1\php-cgi.exe Name: PHP8 Request Restrictions Builder FactoryAppServi criptHandlerFactoryAppServi criptResourceIntegrated-4.0 impleHandlerFactory-Integra Features View Features View	O .rures *.rules *_AppService.axd *ScriptResource.axd *.ashx *b	Enabled Enabled	? × Cancel Unspec Unspec Unspec Unspec Unspec	ified ified ified ified	Handler IsapiModule IsapiModule System.Web.Handlers IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule System.ServiceModel. IsapiModule IsapiModule System.ServiceModel. IsapiModule System.Web.UI.Pagel- IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule IsapiModule System.Web.UI.Simple System.Web.UI.Simple	×	Edit Remove Edit Feature Permissions Revert To Parent View Ordered List Help

At the Website level, in order to disable the particular version of PHP that you will not be using, you may be able to select the unwanted mapping and click remove at the right, or select the unwanted php version and select edit permissions and disable "script" access for the unwanted mapping.

Configure the php.ini File

 In the c:\php_8_1 folder, open the php.ini-production file using a good text editor like Notepad++ and then "save as" the contents of this file using the new file name "php.ini" and then close (x) both the php.ini-production file (tab) and the new php.ini file (tab) from within Notepad++.

- 2. Re-open the php.ini file using Notepad++ text editor and then un-comment and modify certain settings within php.ini as follows:
- 3. Set fastcgi.impersonate = 1 ;REMARK FastCGI under IIS supports the ability to impersonate security tokens of the calling client. This allows IIS to define the security context that the request runs under.
- Set cgi.fix_pathinfo = 0 ;REMARK The cgi.fix_pathinfo provides PATH_INFO/PATH_TRANSLATED support for Common Gateway Interface (CGI). Setting this to 1 will cause PHP CGI to fix its paths to conform to the specification.
- 5. Set cgi.force_redirect = 0
- 6. Set open_basedir = a path pointing to a folder or network path where the content of the Web site(s) is located. (Such as c:\hostdata), or just leave it commented like this ";open_basedir =" without the quotes
- Set extension_dir to point to a location where PHP extensions reside. This is typically extension_dir = "./ext" However, per remarks in the "php.ini-production" file in both PHP7 and PHP8 it says for "Windows" set it instead as follows: extension_dir = "ext"
- Set error_log="C:php_errors.log" ;REMARK This can help with troubleshooting. Alternatively, set error_log = "c:\php\logs\errors_log" and make a new sub-folder in c:php named "logs" and grant the sub-folder "logs" full control write access for both IUSR and IIS_USERS.
- 9. Enable the required PHP extension by un-commenting the appropriate lines within the extensions section of the php.ini file. See a further discussion of which extensions to enable.

Enable Extensions in the php.ini file for PHP 8

Using Notepad++ or similar text editor, find and edit the php.ini file to enable extensions. Make sure that the applicable/corresponding php_*.dll file for the extension that you wish to activate is still available within the latest php8/ext/ directory

See the following screen snippet for examples:

929	extension=bz2
930	; REM ENABLED curl ON PHP8 INSTALLATION
931	extension=curl
932	;extension=ffi
933	; REM ENABLED ftp ON PHP8 INSTALLATION
934	extension=ftp
935	; REM ENABLED fileinfo ON PHP8 INSTALL?
936	extension=fileinfo
937	; REM ENABLED gd ON PHP8 INSTALLATION]
938	extension=gd
939	;extension=gettext
940	;extension=gmp
941	; REM ENABLED php_intl.dll ON INSTALL (
942	extension=intl
943	; REM ENABLED imap ON PHP8 INSTALLATION
944	extension=imap
945	;extension=ldap
946	; REM ENABLED mbstring ON PHP8 INSALLA1
947	extension=mbstring
948	;extension=exif ; Must be after mk
949	; REM ENABLED mysqli on PHP8 INSTALLATI
950	extension=mysqli
951	;extension=oci8_12c ; Use with Oracle
952	;extension=oci8_19 ; Use with Oracle I
953	;extension=odbc
954	; REM ENABLED openssl ON PHP8 INSTALLAT
955 956	extension=openssl
956	;extension=pdo_firebird ; REM ENABLED pdo mysql ON PHP8 INSTALI
958	extension=pdo mysql
959	;extension=pdo_mysqi
960	;extension=pdo_odbc
961	; REM ENABLED pdo pgsql ON PHP8 INSTALI
962	extension=pdo pgsql
963	;extension=pdo sqlite
964	;extension=pgsql
965	;extension=shmop
966	-
967	; The MIBS data available in the PHP di
968	; See https://www.php.net/manual/en/snr
969	;extension=snmp
970	
971	; REM ENABLED soap ON PHP8 INSTALLATI(
972	extension=soap
973	;extension=sockets
974	;extension=sodium
975	;extension=sqlite3
976	;extension=tidy
977	; REM ENABLED xsl ON PHP8 INSTALLATION
978	extension=xsl

Enable File Uploads in php.ini file for PHP 8

Use a file editor like Notepad++ to edit the php.ini file.

By default file uploads are enabled.

file_uploads = On

See the following screen snippet for examples of extensions to enable:

```
846
847
        848
        ......
849
850
        ; Whether to allow HTTP file uploads.
851
        ; https://php.net/file-uploads
852
853
        file_uploads = On
854
        ; Temporary directory for HTTP uploaded files (will use system default if not
        ; specified).
856
        ; https://php.net/upload-tmp-dir
857
858
        ;upload_tmp_dir =
; REM CONFIGURED PHP 8 UPLOADS DIRECTORY AND ADDED \temp\uploads FOLDERS AND ENABLED IUSR WRITE PERMISSIONS ON "uploads" DIRECTORY
859
        upload_tmp_dir="c:\php_8_1\temp\uploads"
860
861
        ; Maximum allowed size for uploaded files.
        ; https://php.net/upload-max-filesize
; REM INSERTED ";" TO DISABLE NEXT LINE WITH 2M LIMIT AND INSTEAD INSERTED 750M LIMIT ON SECOND LINE
862
864
        ; upload_max_filesize = 2M
865
866
        upload_max_filesize = 750M
        ; Maximum number of files that can be uploaded via a single request
; REM DISABLED 20 ON NEXT LINE AND INSERTED AND ENABLED 60 SECOND LINE
;max_file_uploads = 20
867
868
869
870
        max_file_uploads = 60
```

Enable Sessions Save Path to New TMP Directory

See the following screen snippet.

```
1391 ; REM ENABLED 2ND LINE -SESSIONS NEED TO WORK FOR PHPMYADMIN, CREATE php_8_1/TMP FOLDER
1392 ; REM (cont) AND GRANT MODIFY AND WRITE PERMISSIONS TO IIS_IUSERS GROUP AND OPTIONALLY IUSR
1393 session.save_path = "c:/php_8_1/tmp"
```
