Nginx: [emerg] bind() to [::]:80 failed (98: Address already in use)

This fixed my problem

Ok, now this is weird. I am pretty sure nginx service was stopped. And I don't have apache or anything running on the server that could use port 80… Could it have been that nginx left some resource that kept port 80 busy while certbot reconfigured/restarted the server?

I killed everything running on port 80…

$ sudo fuser -k 80/tcp 80/tcp: 3488 3489 3490

after that nginx started normally…
